

Green Solution Comparison

New Green Solution

This is a comparison example between 4 Standard PCs plus a Server versus 4 Thin Client Terminals plus a Server. Thin Client Terminals have no moving parts, such as, fans, hard drives etc, therefore have an extended life over a conventional PC.

The solution using Terminals instead of PCs means less failures, all data centrally stored and backed up on a Server, plus central management and the best thing of all, Terminals are cheaper than PCs and have very low running cost and are kind to the environment by using less power consumption.

Note: Power consumption may vary slightly on products from different manufacturers.

Below is a table which details the power savings:-
